KEYCALIBER

AI GOVERNANCE · INVENTORY · EXPOSURE

Find every AI in your business — including the AI nobody approved, installed, or noticed.

Shadow AI arrived through free signups, tools people installed themselves, and vendors switching AI features on inside software you already bought. KeyCaliber finds all of it **from the security tools you already own**, ranks it by what it can actually reach, and keeps the record of what you decided.

NO AGENT · NO PROXY · NO BROWSER EXTENSION · READ-ONLY ACCESS

01 GOVERNANCE

Approve it for six people. Watch the rest surface.

A status on every AI tool, and the paper trail behind every call your team made.

- **Five clear states**: unreviewed, evaluating, approved for everyone, approved for select groups/users, prohibited.
- **Export the evidence** — track who decided what and when.

02 INVENTORY

Find the model running on a laptop in Finance.

One list, built from signals your existing tools already collect so it stays current without anyone chasing it.

- **AI domains in your traffic flows** — every connection out to an AI service
- **AI running on laptops and servers**, from the software inventory your endpoint tools already gather.
- **AI switched on inside SaaS apps you already approved**, with the vendor's data-training policy.

03 EXPOSURE

Not 400 users. The ones on the payroll server.

Every finding tied to the systems it can reach and the people using it, then ranked by what's at stake.

- **Ranked by business impact**, not by how popular the tool is or how loud the alert is.
- **Shows AI on your most valuable systems,** and where those systems are missing security controls.
- **Every score breaks down** into the factors behind it, so your team can check the ranking.

Ranked by business impact

Every finding arrives attached to what the affected system is worth to the business.

AI others can't see

AI running locally on laptops, and AI switched on inside apps you already approved.

Auditable by design

What can't be confirmed is marked unconfirmed, never rounded down to zero.

Nothing to deploy

Read-only access to tools you already run, so security review doesn't stall the project.

See it against your own environment.

A short proof-of-value uses read-only access to the tools you already run and returns a real list from your business. **Connect in an afternoon; first picture in hours.**
